

Credit Name: CSE 2140 2nd Language Programming

Assignment Name: AddCoins mastery

How has your program changed from planning to coding to now? Please explain?

At the moment of creating the getDollarAmount() method, I used a way that didn't use the string.format() but the decimal format

```
import java.text.DecimalFormat;

static String getDollarAmount(int pennies, int nickels, int dimes, int quarters) {
    int totalCents = pennies + (nickels * 5) + (dimes * 10) + (quarters * 25);
    double dollars = totalCents / 100.0;

    DecimalFormat df = new DecimalFormat("#.00");
    return df.format(dollars);
}
```
